

## EXPERIMENT-5

Name: Payal Kumari UID:22BCS10967 Section: 619-B

**Problem 1: Write a Java program to calculate the sum of a list of integers using autoboxing and unboxing, along with methods to parse strings into their respective wrapper classes (e.g., Integer.parseInt()).**

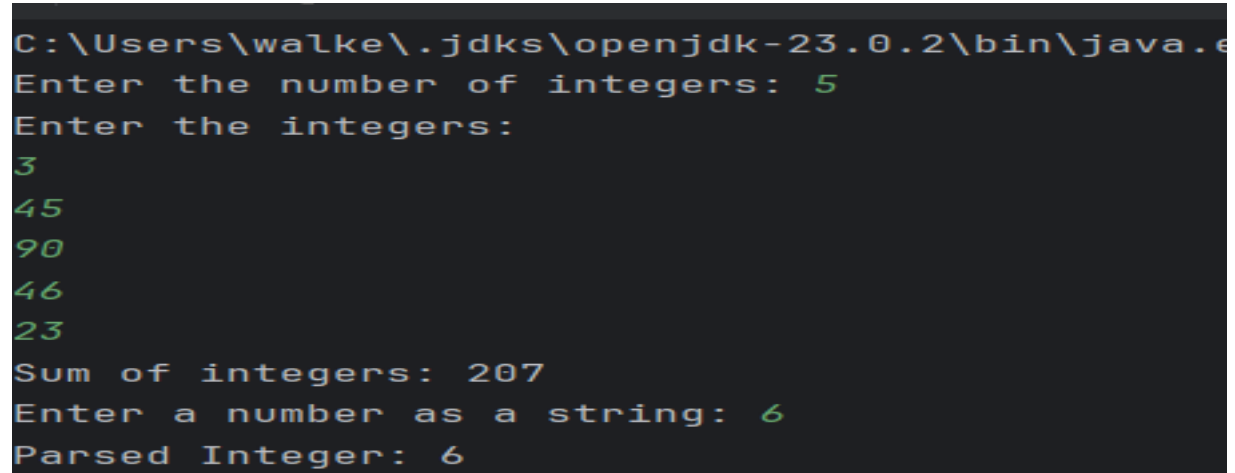

### CODE:

```
import java.util.ArrayList;
import java.util.Scanner;

public class AutoboxingUnboxing {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);
        System.out.print("Enter the number of integers: ");
        int n = scanner.nextInt();
        ArrayList<Integer> numbers = new ArrayList<>();
        System.out.println("Enter the integers: ");
        for (int i = 0; i < n; i++) {
            int num = scanner.nextInt();
            numbers.add(num);
        }
        int sum = 0;
        for (Integer num : numbers) {
            sum += num;
        }
        System.out.println("Sum of integers: " + sum);
        System.out.print("Enter a number as a string: ");
        String strNum = scanner.next();
        Integer parsedNum = Integer.parseInt(strNum);
        System.out.println("Parsed Integer: " + parsedNum);
    }
}
```

```
scanner.close();  
}
```

**OUTPUT:**

```
C:\Users\walke\.jdk\openjdk-23.0.2\bin\java.exe  
Enter the number of integers: 5  
Enter the integers:  
3  
45  
90  
46  
23  
Sum of integers: 207  
Enter a number as a string: 6  
Parsed Integer: 6
```

## **Problem 2: Serialization and Deserialization of a Student Object in Java**

**This Java program demonstrates serialization and deserialization of a Student object**

**CODE:**

```
import java.io.*;  
import java.util.Scanner;  
  
class Student implements Serializable {  
    private static final long serialVersionUID = 1L;  
    private String name;  
    private int age;  
    private String course;  
    public Student(String name, int age, String course) {  
        this.name = name;  
        this.age = age;  
        this.course = course;  
    }  
    public String toString() {
```

```

        return "Student{name='" + name + "', age=" + age + ", course='" + course + "'}";
    }
}

```

```

public class StudentSerialization {
    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        System.out.print("Enter student name: ");
        String name = scanner.nextLine();
        System.out.print("Enter student age: ");
        int age = scanner.nextInt();
        scanner.nextLine();
        System.out.print("Enter student course: ");
        String course = scanner.nextLine();

        Student student = new Student(name, age, course);

        try (ObjectOutputStream out = new ObjectOutputStream(new
FileOutputStream("student.ser"))) {
            out.writeObject(student);
            System.out.println("Student object serialized successfully.");
        } catch (IOException e) {
            e.printStackTrace();
        }

        try (ObjectInputStream in = new ObjectInputStream(new
FileInputStream("student.ser"))) {
            Student deserializedStudent = (Student) in.readObject();
            System.out.println("Deserialized Student: " + deserializedStudent);
        } catch (IOException | ClassNotFoundException e) {
            e.printStackTrace();
        }
    }
}

```

```
        scanner.close();
    }
}
```

### OUTPUT:

A screenshot of a terminal window showing the execution of a Java application. The command prompt shows the path to the Java executable. The user enters 'Payal' for the student name, '21' for the student age, and 'CSE' for the student course. The application outputs 'Student object serialized successfully.' and 'Deserialized Student: Student{name='Payal', age=21, course='CSE'}'. The process finishes with exit code 0.

```
C:\Users\walke\.jdk\openjdk-23.0.2\bin\java.exe "-javaagent:C:\Progra
Enter student name: Payal
Enter student age: 21
Enter student course: CSE
Student object serialized successfully.
Deserialized Student: Student{name='Payal', age=21, course='CSE'}

Process finished with exit code 0
```

**Problem 3: To create a menu-based Java application that allows the addition and display of employee details, and stores this information in a file for persistence.**

### CODE:

```
import java.io.*;
import java.util.Scanner;

class Employee implements Serializable {
    private static final long serialVersionUID = 1L;
    private int id;
    private String name;
    private String designation;
    private double salary;

    public Employee(int id, String name, String designation, double salary) {
        this.id = id;
        this.name = name;
        this.designation = designation;
        this.salary = salary;
    }

    public String toString() {
        return "Employee ID: " + id + "\nName: " + name + "\nDesignation: " + designation +
            "\nSalary: " + salary + "\n";
    }
}
```

```

public class EmployeeManagement {
    private static final String FILE_NAME = "employees.ser";

    public static void main(String[] args) {
        Scanner scanner = new Scanner(System.in);

        while (true) {
            System.out.println("\nEmployee Management System");
            System.out.println("1. Add Employee");
            System.out.println("2. Display All Employees");
            System.out.println("3. Exit");
            System.out.print("Enter your choice: ");
            int choice = scanner.nextInt();
            scanner.nextLine();

            switch (choice) {
                case 1:
                    addEmployee(scanner);
                    break;
                case 2:
                    displayEmployees();
                    break;
                case 3:
                    System.out.println("Exiting program...");
                    scanner.close();
                    return;
                default:
                    System.out.println("Invalid choice! Please enter 1, 2, or 3.");
            }
        }
    }

    private static void addEmployee(Scanner scanner) {
        System.out.print("Enter Employee ID: ");
        int id = scanner.nextInt();
        scanner.nextLine(); // Consume newline
        System.out.print("Enter Name: ");
        String name = scanner.nextLine();
        System.out.print("Enter Designation: ");
        String designation = scanner.nextLine();
        System.out.print("Enter Salary: ");
        double salary = scanner.nextDouble();
        Employee employee = new Employee(id, name, designation, salary);
    }
}

```

```

        try (ObjectOutputStream out = new ObjectOutputStream(new
FileOutputStream(FILE_NAME, true))) {
            out.writeObject(employee);
            System.out.println("Employee added successfully!");
        } catch (IOException e) {
            e.printStackTrace();
        }
    }

    private static void displayEmployees() {
        try (ObjectInputStream in = new ObjectInputStream(new
FileInputStream(FILE_NAME))) {
            while (true) {
                Employee employee = (Employee) in.readObject();
                System.out.println(employee);
            }
        } catch (EOFException e) {
        } catch (IOException | ClassNotFoundException e) {
            e.printStackTrace();
        }
    }
}

```

## OUTPUT:

```

C:\Users\walke\.jdk\openjdk-23.0.2\bin\java.exe "-javaagent:C:\Program Fi
